*A critical impurity is any component other than the target compound that contains a phosphoramidite moiety and a DMT (or equivalent acid labile) protecting group. Any unknown impurity is considered to be critical.

Phosphoramidites are sensitive to environmental conditions when in powder or liquid form. Take precautions to avoid potential precipitation, degradation or hydrolysis that can affect performance or delivery of the phosphoramidite during synthesis. Control temperature, humidity, and exposure time to air for both the phosphoramidite and diluent.
